Class 06 R Functions Lab

Cindy Tran

1/22/2022

This week we are introducing **R** functions and how to write our own functions.

Questions to answer:

Q1. Write a function grade() to determine an overall grade from a vector of student homework assignment scores dropping the lowest single score. If a student misses a homework (i.e. has an NA value) this can be used as a score to be potentially dropped. Your final function should be adequately explained with code comments and be able to work on an example class gradebook such as this one in CSV format: "https://tinyurl.com/gradeinput" [3pts]

```
# Example input vectors to start with
student1 <- c(100, 100, 100, 100, 100, 100, 100, 90)
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
```

Follow the guidelines form class - Write a working snippet of code that solves a simple problem

```
# Straightforward mean()
student1 <- c(100, 100, 100, 100, 100, 100, 90)
mean(student1)</pre>
```

[1] 98.75

But... we need to drop the lowest score. First we need to identify the lowest score.

```
# Which element of the vector is the lowest?
which.min(student1)
```

[1] 8

What I want is to now drop (i.e. exclude) this lowest score from my mean() calculation

```
#This will return everything but the eighth element of the vector
student1[-8]
```

[1] 100 100 100 100 100 100 100

Now we can use the answer from which min to return all other elements of the vector

```
# This is our first working snippet
mean(student1[-which.min(student1)])
```

[1] 100

What about the other example students? Will this work for them?

We could try usng na.rm = TRUE argument, but this is not a good approach.

```
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
mean(student2, na.rm = TRUE)
```

[1] 91

```
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA, NA)
mean(student3, na.rm = TRUE)</pre>
```

[1] 90

Another approach is to mask (i.e. replace all NA values with zero).

First we need to find the NA elements of the vector. How do we find the NA elements?

```
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
x <- student2
is.na(x)</pre>
```

[1] FALSE TRUE FALSE FALSE FALSE FALSE FALSE

```
which(is.na(x))
```

[1] 2

Now we have identified the NA elements. We want to "mask" them (replace them with zero).

```
# This does not quite get us there
mean(x[-which(is.na(x))])
```

[1] 91

Instead, we will make the NA elements zero

```
# This is useful!
x[is.na(x)] <- 0
x</pre>
```

[1] 100 0 90 90 90 97 80

```
mean(x)
## [1] 79.625
Recall we should drop the lowest score now...
x[is.na(x)] \leftarrow 0
mean(x[-which.min(x)])
## [1] 91
Now we are essentially there with our working snippet!
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
x <- student3
x[is.na(x)] \leftarrow 0
mean(x[-which.min(x)])
## [1] 12.85714
Now we make our function
Take the snippet and turn into a function. Every function has 3 parts
   • A name, in our case, 'grade()'
   • Input arguments, a vector of student scores
   • The body, i.e. our working snippet of code
Using RStudio, I will select 'Code > Extract Function'
grade <- function(x) {</pre>
  x[is.na(x)] \leftarrow 0
  mean(x[-which.min(x)])
}
grade(student1)
## [1] 100
grade(student2)
```

```
## [1] 12.85714
```

grade(student3)

[1] 91

This looks great! We now need to add comments to explain this to our future selves and others who want to use this function.

```
#' Calculate the average score for a vector of students' scores dropping the lowest score.
#' Missing values will be treated as zeroes.
#' @param x A numeric vector of homework scores
#'
#' Oreturn Average score
#' @export
#'
#' @examples
#' student <- c(100, NA 90, 97)
#' grade(student)
#'
grade <- function(x) {</pre>
  # mask NA with zero
  # Treat missing values as zero
  x[is.na(x)] \leftarrow 0
  # Exclude score from mean
  mean(x[-which.min(x)])
}
```

Now, finally, we can use our function on our "real" whole class data from this CSV format file: "https://tinyurl.com/gradeinput"

```
url <- "https://tinyurl.com/gradeinput"
gradebook <- read.csv(url, row.names = 1)</pre>
```

```
apply(gradebook, 1, grade)
```

```
##
    student-1 student-2 student-3 student-4 student-5 student-6
                                                                        student-7
##
        91.75
                   82.50
                              84.25
                                          84.25
                                                     88.25
                                                                 89.00
                                                                            94.00
    student-8

        93.75
                   87.75
                              79.00
                                          86.00
                                                     91.75
                                                                 92.25
                                                                            87.75
  student-15 student-16 student-17 student-18 student-19 student-20
##
##
        78.75
                   89.50
                              88.00
                                          94.50
                                                     82.75
                                                                 82.75
```

Q2. Using your grade() function and the supplied gradebook, Who is the top scoring student overall in the gradebook? [3pts]

To answer this, we run the apply() function and save the results.

```
results <- apply(gradebook, 1, grade)
sort(results, decreasing = TRUE)</pre>
```

```
## student-18
               student-7
                          student-8 student-13 student-1 student-12 student-16
##
        94.50
                   94.00
                               93.75
                                          92.25
                                                     91.75
                                                                 91.75
                                                                            89.50
##
    student-6
               student-5 student-17
                                      student-9 student-14 student-11
                                                                        student-3
##
        89.00
                   88.25
                               88.00
                                          87.75
                                                     87.75
                                                                 86.00
                                                                            84.25
##
    student-4 student-19 student-20
                                     student-2 student-10 student-15
                   82.75
                                          82.50
                                                     79.00
                                                                 78.75
##
        84.25
                               82.75
```

```
which.max(results)
```

boxplot(gradebook)

```
## student-18
## 18
```

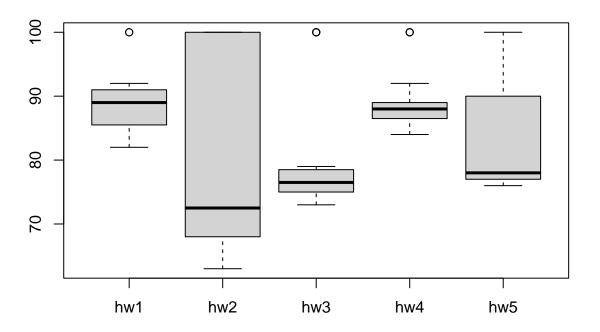

Q3. From your analysis of the gradebook, which homework was toughest on students (i.e. obtained the lowest scores overall? [2pts]

```
ave.scores <- apply(gradebook, 2, mean, na.rm = TRUE)
which.min(ave.scores)

## hw3
## 3

med.scores <- apply(gradebook, 2, median, na.rm = TRUE)
which.min(med.scores)

## hw2
## 2</pre>
```

Homework 2 was the toughest on students.

Q4. Optional Extension: From your analysis of the gradebook, which homework was most predictive of overall score (i.e. highest correlation with average grade score)? [1pt]

Are the final results (i.e. average score for each student) correlated with the results (i.e. scores) for individual homeworks - the gradebook columns?

```
masked.gradebook <- gradebook
masked.gradebook[is.na(masked.gradebook)] <- 0
masked.gradebook</pre>
```

```
